# GENERIC NAMES OF SOME CHELYID TURTLES.

BY LEONHARD STEJNEGER.

The generic name *Hydraspis* Bell is currently applied to a group of South American Chelyid turtles which has Schweigger's *Emys geoffroana* as type. This practice is quite erroneous, however.

The name was instituted by Thomas Bell in 1828 (Journ. Zool., vol. 3, p. 512). In doing so he said: "I had long ago believed that Testudo longicollis might prove to be the type of a genus, and subsequent observations upon several other species has convinced me that the conjecture was correct," and further down, in enumerating the species which he includes in this genus he begins with "Testudo longicollis, which I consider the type." This is consequently a case to which Art. 30, sec. a of the International Rules of Zoological Nomenclature applies directly, viz: "When in the original publication of a genus, one of the species is definitely designated as type, this species shall be accepted as type regardless of any other considerations. (Type by original designation.)"

It is of no consequence that Bell in another paper printed immediately after the one alluded to above, under the genus Hydraspis designates another species as type as follows: "Sp. typ. H. galeata ( $Testudo\ galeata$ . Anct.)" (Journ. Zool. vol. 3, 1828, p. 515), especially since this action of his has nothing to do with the subsequent one of Gray in diverting Hydraspis to the group represented by E. geoffroana.

But by designating *T. longicollis* as the type of *Hydraspis*, Bell overlooked the fact that Fitzinger two years previously had designated the same species as type of *Chelodina*. In his Neue Clas-

sification der Reptilien, 1826, p. 6, Fitzinger says that "Oppel indicated the separation of *Emys longicollis* and its consorts which I include in my genus *Chelodina*." *Hydraspis*, therefore, is only a synonym of *Chelodina* and must disappear as a valid generic term.

The question now arises as to the proper name for the genus eurrently known by this term.

In 1830 Wagner (Syst. Amph., p. 134) established the genus Rhinemys for four species, viz.: Emys rufipes Spix; E. nasuta Schweigger; E. radiolata Mikan; and E. gibba Schweigger, without designating any type. This was done in 1843 by Fitzinger (Syst. Rept., p. 29) who specifically designated Rhinemys rufipes Wagler as the type. Wagler in the same publication, but on a subsequent page (Syst. Amph., 1830, p. 135), established the monotypic genus Phrynops for Emys geoffroana. These two speeies have since proved to be congeneric, and one of the generie terms applied to them must serve for the combined genus. Here Art. 28 of the International Rules of Zoological Nomenclature provides as follows: "A genus formed by the union of two or more genera or subgenera takes the oldest valid generic or subgeneric name of its components. If the names are of the same date, that selected by the first reviser shall stand." The first reviser in this case was J. E. Gray (Cat. Tortois., Brit. Mus., 1844, p. 41), who included both E. geoffroana and E. rufipes in the same genus, for which he selected Phrynops as the name, at the same time distinctly giving "Phrynops and Rhinemys Wagler" as synonyms. This action consequently "shall stand," to use the phrase of the International Rules.

By this combined action of Fitzinger and Gray the genus represented by Schweigger's *Emys nasuta* is deprived of a valid name. Boulenger (Cat. Chel. Brit. Mus., 1889, p. 217) applied to it Wagler's name *Rhinemys*, but as we have seen, the type of the latter, as designated by Fitzinger, is *E. ruţipes*. There being no other name available I propose to call this genus **Batrachemys** (from  $\beta \alpha \tau \rho \dot{\alpha} \chi \sigma s$ , frog;  $\epsilon \mu \nu s$ , turtle).

The synonymies of these genera, as here mentioned, would then stand as follows:

## Chelodina Fitzinger.

1826. Chelodina Fitzinger, Neue Classif. Rept., p. 6 (type, by orig. desig. Emys longicollis).

1828. *Hydraspis* Bell, Zool. Journ., vol. 3, p. 512 (type, by orig. desig. *Testudo longicollis*).

# Includes the following species:

- 1. Chelodina longicollis (Shaw).
- 2. Chelodina novac-guineæ Boulenger.
- 3. Chelodina expansa Gray.
- 4. Chelodina siebenrocki Werner.
- 5. Chelodina oblonga Gray.

#### Phrynops Wagler.

- 1830. Rhinemys Wagler, Syst. Amph., p. 134 (type, by subsequent desig. by Fitzinger in 1843, R. rufipes).
- 1830. *Phrynops* Wagler, Syst. Amph., p. 135 (monotype, *Emys geoffrouna* Schweigger).

### Includes the following species:

- 1. Phrynops geoffroana (Schweigger).
- 2. Phrynops hilarii (Duméril and Bibron).
- 3. Phrynops tuberosa (Peters).
- 4. Phrynops rufipes (Spix).
- 5. Phrynops wagleri (Duméril and Bibron).

### Batrachemys Stejneger.

1889. Rhinemys Boulenger, Cat. Chel. Brit. Mus., p. 217 (monotype, Emys nasuta, Schweigger) (not of Wagler as restricted by Fitzinger, 1843).

#### Includes:

1. Batrachemys nasuta (Schweigger).
